Cloned rhizobium meliloti ntrA gene - for use in C4-dicarboxylate cloned rhizobium meliloti, symbiotic nitrogen fixation and identifying pathogenic genes.

Claim 1; Page 12; 19pp; English.

The ntrA gene product is a transcriptional activator. It controls processes of nitrate assimilation, symbiotic nitrogen fixation and C4-dicarboxylate transport, working in conjunction with NtrC, NifA carboxylate transport, working in conjunction with NtrC and C4-dicarboxylate transport, working in conjunction with NtrC and C4-dicarboxylate transport, working in conjunction with NtrC and C4-dicarboxylate transport as the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           18-DEC-1996;

                                   New isolated human genes
Claim 5; Page 174-176; 184pp; English.
This sequence is encoded by a human gene of the invention, repressed in the presence of the recoded by a human gene of the invention, repressed in the presence of HCMV infection, designated HCMV-repressible genes (orgor crgs). The invention also relates to genes that are induced to express by both HCMV and interferon (IFN), designated HCMV-inducible genes (cig or cigs). The products can be used to obtain agents which can be used for anti-viral therapy, particularly anti-HCMV therapy. They can also be used for the development of drugs that would allow for higher dosage IFN treatments without the concomitant toxicity normally associated with administering high levels of IFN. The products can also be used for administering high levels of IFN. The products can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a novel ceramide glucosyltransferase (GlcT-1), which has catalytic activity for glucose transfer from UDP-glucose to ceramide. Ceramide glucosyltransferase catalyses the first glycosylation step of glycosphingoceramide to produce glucosylceramide, a precursor to more than 300 glycosphingolipid biosyntheses. The sequence can be used in biochemistry and biotechnology areas as laboratory agents, and also as preparatory agents. For the manufacture of pharmacological active substances. It is expected to have use in therapeutic and preventive treatment of glassess: based on reduced expression of ceramide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                     IgG-Fc binding protein.
Fragment 13; pNV11-ST; IgG-Fc binding human; colonic epithelium; monoclonal
                                                                                                                                                                                                                                                                                                                                                                                  DNA derived from colonic epithelium encoding IgG-Fc binding protein used in the mapping and analysis of IgG-Fc binding protein mRNA claim 1; Page 71-84; 132pp; Japanese.

This sequence is encoded by fragment 13 which is a NotI/KpnI fragment from pNVII-ST. This sequence represents a portion of the IgG-Fc binding protein of human colonic epithelium. This sequence was used in the isolation of the full length sequence given in WI4/49. mRNA isolated from human colonic epithelial tissue was used to prepare a cDNA library. This was screened using monoclonal antibodies K9 and K17 which bind to the large and small components of the binding protein. Pactive clones, see also T63077-81, were used to derive probes for screpning a second DNA library from human colonic epithelial tissue.
                                                                                                  W14749 standard; Protein; W14749;

New modified butyrophilin - not cross-reactive with myelin proligo-dendrocyte glycoprotein, useful in dairy products, vaccines, pr and assays for susceptibility to multiple sclerosis

PT and assays for susceptibility to multiple sclerosis

PT and assays for susceptibility to multiple sclerosis

PT and assays for susceptibility to multiple sclerosis

PT and assays for susceptibility to multiple sclerosis

PT and assays for susceptibility to Miltiple sclerosis

PT and assays for susceptibility product of the miltiple sclerosis (MS). The invention provides methods of the modifying BTN to eliminate sequences that elicit this immune component to MGG, e.g. by removing or modifying the Igi domain of a CC non-human BTN (nbBTN) in a ddary product, or by producing a numanised chimeric BTN. The invention includes genetic manipulation CC of the endogenous BTN gene of an animal such that the human Igi CC domain is introduced into the germiline of the animal, and the CC uncertage and for identify susceptibility to MS in a human patient from the provides of an animal and the development of the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the susceptibility to MS in a human patient from the primary and the primary and the primary and the primary and the primary and

This sequence represents the IgG-Fc binding protein of human colonic epithelium. This sequence was isolated using the sequence given in w14748. mRNA isolated from human colonic epithelial tissue was used to prepare a cDNA library. This was screened using monoclonal antibodies K9 and K17 which bind to the large and small components of the binding protein. Active clones, see also T63077-81, were used to derive probes for screening a second DNA library from human colonic epithelial tissue. Sequence 5405 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1551

possible, by screening the p
gene with domains which are
agonists or antagonists
Claim 3; Page 6-11; 21pp; German.
This sequence represents a head activator binding protein isolated from Chlorohydra viridissima by chromatographic methods. The protein is used in a screening assay for agonists or antagonists comprising determining the binding properties of candidate substances with the protein. The assay can be used to screen for substances useful for treating neurodegenerative diseases.

   y viral protein

Y viral protein

Scalaim 20; Page 31-44; 64pp; English:

The sequence of the polyprotein encoded by the polycistronic mRNA

C (T47073) of maize dwarf mosaic virus strain B (MDMV-B) is given in

CC W10344. New chimaeric genes comprise a monocotyledonous plant

CC promoter linked to a modified nucleic acid sequence derived from

CC the MDMV-B genome. The modification is such that mRNA is translated

CC to a truncated protein (pref. smaller than 200 amino acids), no

CC translation of mRNA occurs or the transcribed mRNA lacks the

CC translation initiation codon or includes a premature stop codon.

CC Expression of the chimaeric gene inhibits infection of plants (pref.

CC sorghum, sugarcane, esp. maize) by MDMV. The transgenic plants

CC display an inheritable resistance trait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     뮍

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2313
        The reshaped antibody sequence was deduced from the sequence of a reshaped human variable heavy chain gene which had a human class; framework but contained mouse CDRs. To reshape a human heavy chait three fragents, each one contg. a murine CDR, were assembled to form gene HuVHIconHMFGI. The reshaped gene was inserted into a new yearter to produce a place of for transformer of a cold
                                                                                                                                                                                                                                                                                                                                                            protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  wPI; 97-108965/10.

R54758 showes an humanised HMFGI heavy chain variable region. The mouse HMFGI is changed at specific residues within the framework region. It is used to generate an SCFV with the humanised HMFGI light chain

The proteins given represent the signal peptide and an CC N-terminal fragment of a secreted protein. The nucleic acid sequences CC can be used for producing secreted human gene products. They can also CC be used to develop products for diagnosis and therapy. The proteins CC obtained may have cytokine activity, cell proliferation/differentiation CC activity, heamatopoiesis regulating activity, tissue growth regulating CC chemokinetic activity—haemostatic and thrombolytic activity, receptor/CC ligand activity, anti-inflammatory activity, tumour inhibition activity cor other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or Sequence 133 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

Nucleic acids encoding human serum protease protein(s) - used idagnosing pre-disposition to Alzheimer's disease, etc. Example 2; Page 18-19; 65pp; English.

The sequence is that of at least a fragment of the serine protease PSP1. This can be used to identify modulators of serine protease activity and also to diagnose a condition associated with lack of one of the serine proteases or a genetic predisposition to neurodegeneration in a patient, preferably predisposition to Alzheimer's disease.

                                  New polypeptide(s) involved in cobalamin and cobamide biosynthesis - and DNA encoding them, for amplification of cobalamin, esp. coenzyme B12 prodn, (Claim 17; Fig 16; 299pp; French.

This sequence corresponds to one of 24 polypeptides obtained from p. dentrificans and implicated in the biosynthesis of cobalamines and/or cobamides, specifically in catalysing the transfer of a methyl group to positions C1, C5, C11, C15 or C17 in the conversion of precorrin-3 to cobyrinic acid a, c-diamide. It is encoded by part of the 8.7kb EcoRI-EcoRI fragment of plasmid pXL367. The plasmid was isolated from a P. denitrificans genomic DNA bank constructed in

Nucleic acids encoding human serum protease protein(s) - us diagnosing pre-disposition to Alzheimer's disease, etc. claim 7; Page 41-42; 65pp; English.

The sequence is that of the consensus sequence of PSP1-3 serine protease which can be used to identify modulators of serine protease activity and also to diagnose a condition associated with lack of one of the serine proteases or a genetic predisposition to neurodegeneration in a patient, preferably predisposition to Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13.3], on equal amounts of mRNA from 2 13.5dpc and 2
14.5dpc embryos [total RNA provided by Minoru Ko, Wayne State Univ. from 2]; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note-Forgan: kidney; Vector: pME18S-FL3; Site_1: DraIII
(CACTOTGTG); Site_2: DraIII (CACCANGTG); lst strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct DraIII sites of the pME18S-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."
